

ELLIPTICAL BLADES create a distinctive architectural feature and can be fixed horizontally or vertically. Blades are manufactured from extruded aluminium and are available in 100mm, 200mm and 600mm series.

Each blade is mechanically fixed to end plates, channel, flat plate, angle or other connection options to achieve the desired pitch and aesthetic look. Main structural supports are required at centres relative to the system being used. Elliptical Blades can be fixed or operable. In the case of the latter, controls can be either standard hand-operated or motorised.

This system offers excellent sun control and privacy screening whilst creating stunning visual appeal. The blades can be powder coated to match existing facades or they can be anodised to suit coastal conditions.
